Asset register

Information at your fingertips

The Mantra asset register is the quick way to organise your data. The information you need is instantly available. You get a view of all your assets so you can make informed decisions and maximise the return on your investment.

Some people call the asset register an equipment database, some call it a plant register - call it what you will, the asset register handles all types of plant and equipment - Mantra has been applied to machinery, chemical plant, vehicles, oil refineries, pharmaceutical research facilities, aircraft engine test bays, breweries, lighthouses.

Save time, save work

Mantra is complete and ready to run. You need no special computer knowledge so all your staff can share information. While your engineers check safety equipment, your accounts department is adding up asset values - all using Mantra. This saves you time - information is entered once instead of separately for each department.

You save even more time when setting up the asset register by using the fast copy facility - at the touch of a button you create another item without having to type all the same details in again. Much information is entered from tables to save time and reduce typing errors. With Mantra you are up and running in a fraction of the time needed by a card-index system.

Organise your assets

You can organise your assets into areas. Areas may be grouped together. You get fast access to your information - whether you have one item or millions of items. You keep track of your assets, their category, location, manufacturer, serial number and all your own details.

Assets can be linked together into hierarchies - each item may have a parent which is another item in the same area. There is no limit to the number of "generations" of parent items you set up and there is no limit to the number of "child items" each asset may have. Linking items helps organise things like production lines with lots of machines and electrical distribution systems with lots of branches.

The built-in report generator means you can prepare reports to show your information just how you want.

Calculations

The supplementary data module is an option which you can add to the asset register. It allows you to hold more data for each asset. Data may be numerical or text, and Mantra can perform calculations on numerical data.

You can generate listings and reports - with Mantra calculating what you want to see.

What you need

The asset register is supplied with the Mantra maintenance management system and runs on standard computers and networks.

You can add the hazardous area and/or supplementary data options to suit your needs.
